MARKEVIAN JONES

Android Developer | Junior Software Engineer

Lake Park, GA | (229) 491-3188 | markdjones20@icloud.com | linkedin.com/in/markevianjones | github.com/markydev1220

PROFESSIONAL SUMMARY

Android Developer specializing in Kotlin-based mobile application development using Android SDK, Jetpack Compose, MVVM, and Clean Architecture. Developed healthcare and real-time multiplayer applications integrating Firebase, WebRTC, CameraX, and StateFlow, reducing Firestore reads by 30% and synchronization latency by 25% through targeted architectural improvements. Applies systematic debugging, root-cause analysis, and system monitoring developed through SCADA-controlled industrial operations to software problem solving and application reliability.

TECHNICAL PROFICIENCIES

- **Programming Languages:** Kotlin, Java, SQL
- **Android Development:** Android SDK, Jetpack Compose, XML, MVVM, Clean Architecture, Navigation Compose, ViewModel, Hilt, Coroutines, StateFlow, CameraX
- **Backend & APIs:** Firebase Authentication, Cloud Firestore, Firebase Storage, Cloud Functions, REST APIs, Retrofit, WebRTC
- **Development Tools:** Android Studio, Git, GitHub, Gradle, Firebase Console
- **Debugging & Performance:** Android Studio Profiler, Logcat, Performance Optimization
- **Core Concepts:** Object-Oriented Programming (OOP), DSA, JSON, Asynchronous Programming, UI State Management

PROJECTS

Android Developer – CareFlow (Healthcare App) | GitHub

Tech Stack: ***Kotlin, Jetpack Compose, MVVM, Clean Architecture, Firebase, Cloud Firestore, CameraX, Retrofit, Coroutines, StateFlow***

- Engineered an Android healthcare application using Jetpack Compose and Navigation Compose to deliver secure patient management, appointment scheduling, and clinical record access through a structured multi-screen workflow.
- Designed the Firestore database structure and implemented StateFlow-based UI state management, reducing database reads per session by approximately **30%**, verified through Firebase Console and Android Studio Profiler.
- Implemented Firebase Authentication, CameraX image capture, and Cloud Firestore to secure user access and manage patient records and medical images within the application.
- Separated presentation, domain, and data responsibilities using Clean Architecture, MVVM, and Hilt dependency injection, reducing component coupling and simplifying future feature enhancements and long-term maintenance.
- Implemented asynchronous data loading with Kotlin Coroutines and Retrofit to prevent UI blocking during network operations, improving application responsiveness across unstable network conditions.

Android Developer – VIRE (Real-Time Multiplayer App) | GitHub

Tech Stack: ***Kotlin, Jetpack Compose, MVVM, Firebase, WebRTC, Retrofit, Coroutines, StateFlow***

- Designed and developed a real-time multiplayer Android application enabling low-latency communication and synchronized gameplay using Kotlin, Jetpack Compose, Firebase, and WebRTC.
- Optimized real-time data synchronization and WebRTC signaling workflows, reducing communication latency by approximately **25%** during multi-device testing.
- Implemented asynchronous network communication with Retrofit and Kotlin Coroutines, preventing UI thread blocking and maintaining responsive user interactions throughout API operations.
- Managed real-time application state using Firebase services and StateFlow, ensuring consistent gameplay synchronization across connected devices while minimizing unnecessary network operations.
- Investigated and resolved synchronization bottlenecks using Android Studio Profiler, Logcat, and Firebase Console, improving application stability and communication reliability during real-time sessions.

PROFESSIONAL EXPERIENCE

Chemical Plant Operator | Saft America / TotalEnergies – ***Valdosta, GA*** **May 2021 – Present**

- Diagnosed failures across SCADA-controlled lithium-ion processing systems through systematic troubleshooting and root-cause analysis, reducing equipment downtime by **20%** while sustaining **99.5% defect-free** production output.
- Analyzed process variables, system alarms, and production data to identify operational deviations, implement corrective actions, and maintain stable production within a high-reliability manufacturing environment.
- Improved operational procedures in collaboration with engineering and quality teams, maintaining OSHA and EPA compliance while reducing chemical spill risk by **40%** through process optimization.

EDUCATION & CERTIFICATION

B.S., Computer Science – ***Full Sail University*** **Jul 2026**
A.S., Computer Science – ***Full Sail University*** **Nov 2024**
Lean Six Sigma White Belt **2025**
